

# **Unveiling the Invisible: The importance of Water Footprint**

Dr. T. Nivetha Assistant Professor (ARM), PGP College of Agricultural Sciences, Namakkal https://doi.org/10.5281/zenodo.11003675

#### Introduction

In the growing concerns of environment, more steps are taken by the researcher, environmentalist and governments to protect our natural ecosystems from air pollution, land pollution, water pollution, climate change and deforestations. The population is increasing day by day at an enormous amount and water sources are decreasing. To prevent the scarcity of water, we should conserve more and understand the concept of water footprint in 21<sup>st</sup> Century.

#### Water footprint

The water footprint of an individual, community or business is defined as the total volume of fresh water used to produce the goods and services consumed by the individual or community or produced by the business. It includes the water it took to produce the food you eat, the products you buy, the energy you consume and even the water you save when you recycle. The use of water may be direct use or indirect use. Direct use is the usage of water by means of direct consumption. Water we use for gardening, cleaning vessels, bathing and washing clothes. Indirect use is the virtual water use, you may not drink, feel or see this water but it makes up the majority of your water footprint. For eg: 1 cup of coffee needs 140 litres of water which means, a cup of coffee needs 140 litres of water to grow, produce, package and ship the beans. It takes a lot of water to produce gasoline. On average, 1 mile driven = about 3/4 of a gallon of water (Johnny Wood, 2019)

### Source: www.waterfootprint.org

A water footprint generally breaks down into three components: the blue, green and grey water footprint. The blue water footprint is the volume of freshwater that is evaporated from the global blue water resources (surface and ground water). The green water footprint is the volume of water evaporated from the global green water resources (rainwater stored in the soil). The grey water footprint is the volume of polluted water, which is quantified as the volume of water that is required to dilute pollutants to such an extent that the quality of the ambient water remains above agreed water quality standards (Mekonnen and Hoekstra, 2011).

#### Water footprint calculator

Number of online websites are available to calculate our water footprints. Some of them are Huella hidrica and United Explanations on water footprint (https://www.active sustainability.Com/sustainable-life/calculate-water-footprint/),watercalculator.org and UNES-CO-IHE. The image below illustrates the process of evaluating one's personal water footprint.

🖲 easycalculation.c	Poultry	Pork	
	Servings Weekly	Servings Weekly	
Does your household use a dishwasher?	NTI.	0-#	
Yes v	Cup Daily	Conee Cup Daily	
Minutes to shower	Transportation Average fuel efficiency of car in m.p.g		
Do you flush when you pee? Yes	Calculat	e Reset	
Loads/Week	Water consumed for diet	Water consumed for transportation	
	gallons	gallons	
	Daily Water consumption by human for person	nal needs	gallor
	Water consumed for Outdoor & Recycle		
	Total Water Consumed		gallor gallor
	Coes your household use a dishwasher?  Yes  Minutes to shower  Do you flush when you pee?  Yes  Loads/Week	Casycalculation.c   Does your household use a dishwasher?   Yes   Minutes to shower   Do you flush when you pee?   Yes   Loads/Week   Do you flush when you pee?   Yes   Water consumed for diet   gallons   Daily Water consumption by human for person   Uader consumed for Outdoor & Recycle   Total Water Consumed	Coes your household use a dishwasher?   Yes   Minutes to shower   Oo you flush when you pee?   Yes   Calculate   Reset   Loads/Week   Daily   Daily   Daily   Water consumed for diet   Water consumed for Outdoor & Recycle   Total Water Consumed

Individual water footprint calculation method

In addition to this, we can calculate product water footprint and national footprint also. This type of model should be developed in all the fields of business to know their water footprint. Limit should be monitored by the authorities to check the footprints level. The percentage of purity and level of ground water level gets decreased due to the produce of products using more virtual water. Eg. Soft drinks

# Conclusion

As we navigate the complexities of the modern world, understanding our water footprint is more important than ever. By unravelling the invisible threads that connect us to the global water crisis, we can become more conscious consumers and stewards of the environment. Let's take the first step towards a more sustainable future by embracing the power of our choices and preserving the life-giving force of water for generations to come. As the world population expands, so does the need for fresh water.
